

Nama: Adrian Maulana Y	 Praktikum Statistika	MODUL 2
NIM: 065002100036		Nama Dosen: Dedy Sugiarto
Hari/Tanggal: Kamis, 22 September 2022		Nama Asisten Labratorium: 1. Azhar Rizki Zulma 065001900001 2. Arfa Maulana 064001900039

Tipe Data, Filter Data & Koneksi ke Database

1. Teori Singkat

R (juga dikenal sebagai GNU S) adalah bahasa pemrograman dan perangkat lunak untuk analisis statistika dan grafik. R dibuat oleh Ross Ihaka dan Robert Gentleman di Universitas Auckland, Selandia Baru, dan kini dikembangkan oleh R Development Core Team, di mana Chambers merupakan anggotanya. R dinamakan sebagian setelah nama dua pembuatnya (Robert Gentleman dan Ross Ihaka), dan sebagian sebagian dari permainan nama dari S.

Bahasa R kini menjadi standar de facto di antara statistikawan untuk pengembangan perangkat lunak statistika, serta digunakan secara luas untuk pengembangan perangkat lunak statistika dan analisis data. R merupakan bagian dari proyek GNU. Kode sumbernya tersedia secara bebas di bawah Lisensi Publik Umum GNU, dan versi biner prekompilasinya tersedia untuk berbagai sistem operasi. R menggunakan antarmuka baris perintah, meski beberapa antarmuka pengguna grafik juga tersedia.

R menyediakan berbagai teknik statistika (permodelan linier dan nonlinier, uji statistik klasik, analisis deret waktu, klasifikasi, klasterisasi, dan sebagainya) serta grafik. R, sebagaimana S, dirancang sebagai bahasa komputer sebenarnya, dan mengizinkan penggunaannya untuk menambah fungsi tambahan dengan mendefinisikan fungsi baru. Kekuatan besar dari R yang lain adalah fasilitas grafiknya, yang menghasilkan grafik dengan kualitas publikasi yang dapat memuat simbol matematika. R memiliki format dokumentasi seperti LaTeX, yang digunakan untuk menyediakan dokumentasi yang lengkap, baik secara daring (dalam berbagai format) maupun secara cetakan.

RStudio merupakan integrated development environment (IDE) khusus bagi bahasa pemrograman R. Software ini menyediakan R console, code editor dengan syntax highlighting, code completion dan direct execution, environment, history, connections, dan fitur-fitur tambahan lainnya seperti file manager, packages manager, help, plot viewer, hingga project versioning menggunakan git. RStudio sebenarnya memiliki dua versi, yaitu open source (gratis) dan commercial edition (berbayar). RStudio juga tidak hanya terbatas dalam bentuk aplikasi dekstop, melainkan terdapat versi RStudio Server, yaitu RStudio yang dapat diakses melalui browser yang terhubung dengan suatu jaringan komputer. Untuk saat ini, versi RStudio yang akan dijelaskan hanyalah RStudio open source berbasis dekstop saja.

2. Alat dan Bahan

Hardware : Laptop/PC

Software : R Studio

3. Elemen Kompetensi

Terdapat beberapa tipe data di R antara lain vektor, matriks dan data frame. Cantumkan setiap output yang dihasilkan dari console Rstudio, ke kolom yang sudah disediakan.

a. Latihan pertama – Vektor

1. Tuliskan Perintah berikut ini di window R Script:

```
a <- c(1,2,-5,0.3,6,-2,4) # numeric vector
b <- c("one","two","three") # character vector
c <- c(TRUE,TRUE,TRUE,FALSE,TRUE) #logical vector
print(a)
print(b)
print(c)
```

Output:

The screenshot shows the RStudio IDE with a script editor on the left and a console on the right. The script editor contains the following code:

```
1 a <- c(1,2,-5,0.3,6,-2,4) # numeric vector
2 b <- c("one","two","three") # character vector
3 c <- c(TRUE,TRUE,TRUE,FALSE,TRUE) #logical vector
4 print(a)
5 print(b)
6 print(c)
7
```

The console on the right shows the output of the script:

```
Type 'demo()' for some demos, 'help()' for on-line help, or
'help.start()' for an HTML browser interface to help.
Type 'q()' to quit R.

> a <- c(1,2,-5,0.3,6,-2,4) # numeric vector
> b <- c("one","two","three") # character vector
> c <- c(TRUE,TRUE,TRUE,FALSE,TRUE) #logical vector
> print(a)
[1] 1.0 2.0 -5.0 0.3 6.0 -2.0 4.0
> print(b)
[1] "one" "two" "three"
> print(c)
[1] TRUE TRUE TRUE FALSE TRUE
>
```

b. Latihan Kedua – Matriks

1. Seluruh kolom dalam sebuah matriks harus memiliki tipe yang sama (numerik semua, karakter semua, dll) dan memiliki panjang yang sama.

**gunakan nama variable dengan nama anda masing-masing*

```
#MATRIKS  
cells <- c(3,15,-27,38)  
r_nama <- c("R1", "R2")  
c_nama <- c("C1", "C2")  
nama_matrix <- matrix(cells, nrow=2, ncol=2, byrow=TRUE,  
  dimnames=list(r_nama, c_nama))  
print(nama_matrix)
```

Output:

The screenshot shows the RStudio interface. The script editor contains the following code:

```
1 a <- c(1,2,3,0,3,6,2,4) # numeric vector  
2 b <- c("one", "two", "three") # character vector  
3 c <- c(TRUE, TRUE, TRUE, FALSE, TRUE) # logical vector  
4 print(a)  
5 print(b)  
6 print(c)  
7  
8 #MATRIKS  
9 cells <- c(3,15,-27,38)  
10 r_nama <- c("R1", "R2")  
11 c_nama <- c("C1", "C2")  
12 adrian_matrix <- matrix(cells, nrow=2, ncol=2, byrow=TRUE,  
13   dimnames=list(r_nama, c_nama))  
14 print(adrian_matrix)  
15
```

The console output shows the execution of the code, including the matrix creation and the resulting matrix structure:

```
1 114200 1730 4 2 2 NO EAST  
2 114200 2030 4 2 3 NO EAST  
3 114800 1740 3 2 1 NO EAST  
4 94700 1980 3 2 3 NO EAST  
5 119800 2130 3 3 3 NO EAST  
6 119200 2110 4 2 3 NO EAST  
7 104000 1730 3 3 3 NO EAST  
8 116200 1790 3 2 3 NO EAST  
9 99300 1700 3 2 2 NO EAST  
10 108600 1560 2 2 1 NO EAST  
11 105600 1990 3 3 3 NO EAST  
12 103200 1810 3 2 3 NO EAST  
13 111900 1980 2 2 2 NO EAST  
14 120500 1910 2 3 2 NO EAST  
15 111900 2040 4 3 3 NO EAST  
16 123700 2040 3 3 2 NO EAST  
17 147700 2410 3 3 2 NO EAST  
18 116500 2130 3 2 2 NO EAST  
19 117100 2080 3 3 2 NO EAST  
20 113300 2440 3 3 3 NO EAST  
21 123100 2260 3 3 3 NO EAST  
22 136800 2410 3 3 4 NO EAST  
23 82300 1910 3 2 4 NO EAST  
24 108700 2110 3 2 3 NO EAST  
25 124500 2010 4 3 2 NO EAST  
26 105600 1930 3 3 3 NO EAST  
> #MATRIKS  
> cells <- c(3,15,-27,38)  
> r_nama <- c("R1", "R2")  
> c_nama <- c("C1", "C2")  
> adrian_matrix <- matrix(cells, nrow=2, ncol=2, byrow=TRUE,  
+   dimnames=list(r_nama, c_nama))  
> print(adrian_matrix)  
      C1 C2  
R1    3 15  
R2   -27 38
```

c. Latihan Ketiga – Data Frame

1. Mengubah data input menjadi data frame

**gunakan nama variable dengan nama anda masing-masing*

```
nama1 <- c(1,2,3,4)  
nama2 <- c("red", "white", "red", NA)  
nama3 <- c(TRUE, TRUE, TRUE, FALSE)  
dataku <- data.frame(nama1, nama2, nama3)  
names(dataku) <- c("ID", "Color", "Passed") # variable names  
print(dataku)
```

Output:

The screenshot shows the RStudio interface with the following components:

- Source Editor:** Contains R code for creating vectors, matrices, and data frames. The code includes comments and function calls like `print()` and `data.frame()`.
- Environment:** Lists objects in the global environment, including `dataku`, `df`, `nana_matrix`, `a`, `adrian1`, `adrian2`, `adrian3`, `b`, `c`, `c_adrian`, `cells`, `myQuery`, and `r_adrian`.
- Console:** Displays the output of the R code, showing the results of matrix operations and data frame creation.
- Files:** Shows the file explorer with a project named `Prak2`.

2. Selanjutnya ketikkan perintah dibawah ini

```
data_nama <- data.frame(id = letters[1:10], x = 1:10, y = 11:20)
print (data_nama)
```

Output:

```
1 a <- c(1,2,-5,0,3,6,-2,4) # numeric vector
2 b <- c("one","two","three") # character vector
3 c <- c(TRUE,TRUE,TRUE,FALSE,TRUE) # logical vector
4 print(a)
5 print(b)
6 print(c)
7
8 ##MATRICES
9 cells <- c(3,15,-27,38)
10 r_adrian <- c("r1", "r2")
11 c_adrian <- c("c1", "c2")
12 adrian_matrix <- matrix(cells, nrow=2, ncol=2, byrow=TRUE,
13 dimnames=list(r_adrian, c_adrian))
14 print(adrian_matrix)
15
16 adrian1 <- c(1,2,3,4)
17 adrian2 <- c("red", "white", "red", NA)
18 adrian3 <- c(TRUE,TRUE,TRUE,FALSE)
19 dataku <- data.frame(adrian1, adrian2, adrian3)
20 names(dataku) <- c("id","color","passed") # variable names
21 print(dataku)
22
23 data_adrian <- data.frame(id = letters[1:10], x = 1:10, y = 11:20)
24 print(data_adrian)
25
```

Environment

Object	Class	Attributes
dataku	data.frame	4 obs. of 3 variables
df	data.frame	26 obs. of 7 variables
nana_matrix	matrix	num [1:2, 1:2] 3 -27 15 38
a	num	[1:7] 1 2 -5 0.3 6 -2 4
adrian1	num	[1:4] 1 2 3 4
adrian2	chr	[1:4] "red" "white" "red" NA
adrian3	logi	[1:4] TRUE TRUE TRUE FALSE
b	chr	[1:3] "one" "two" "three"
c	logi	[1:5] TRUE TRUE TRUE FALSE TRUE
c_adrian	chr	[1:2] "c1" "c2"
cells	num	[1:4] 3 15 -27 38
myQuery	chr	"select * from adrian;"
r_adrian	chr	[1:2] "r1" "r2"

Console

```
> adrian1 <- c(1,2,3,4)
> adrian2 <- c("red", "white", "red", NA)
> adrian3 <- c(TRUE,TRUE,TRUE,FALSE)
> dataku <- data.frame(adrian1, adrian2, adrian3)
> names(dataku) <- c("id","color","passed") # variable names
> print(dataku)
  id color passed
1 1 red TRUE
2 2 white TRUE
3 3 red TRUE
4 4 <NA> FALSE
>
> data_adrian <- data.frame(id = letters[1:10], x = 1:10, y = 11:20)
> print(data_adrian)
  id x y
1 a 1 11
2 b 2 12
3 c 3 13
4 d 4 14
5 e 5 15
6 f 6 16
7 g 7 17
8 h 8 18
9 i 9 19
10 j 10 20
```

Beberapa fungsi penting terkait data frame :

head() - shows first 6 rows

tail() - shows last 6 rows

dim() - returns the dimensions of data frame (i.e. number of rows and number of columns)

nrow() - number of rows

ncol() - number of columns

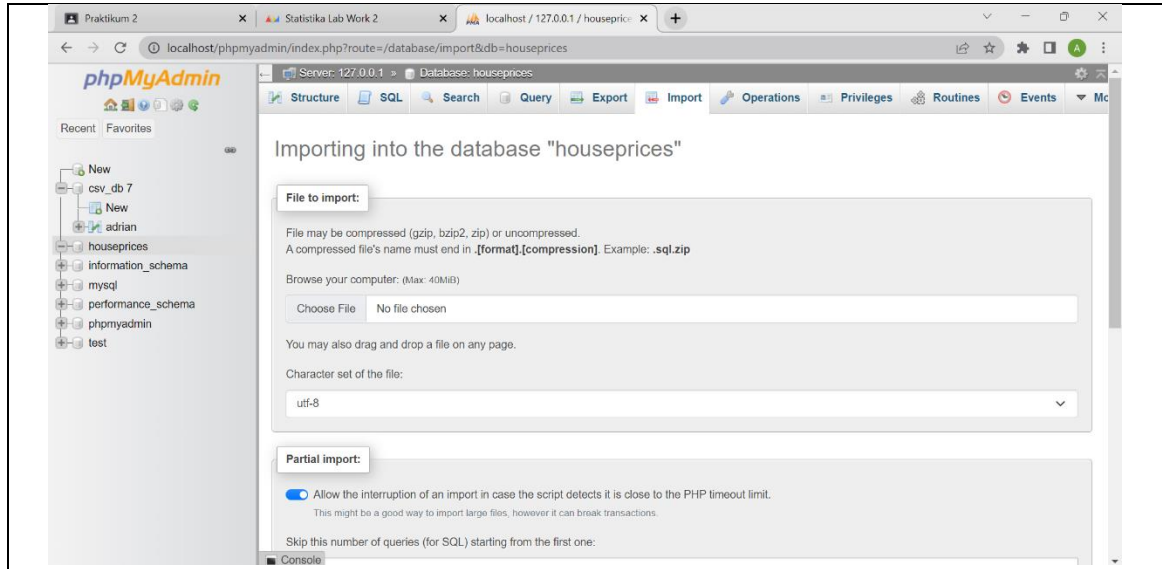

str() - structure of data frame - name, type and preview of data in each column

names() - shows the names attribute for a data frame, which gives the column names.

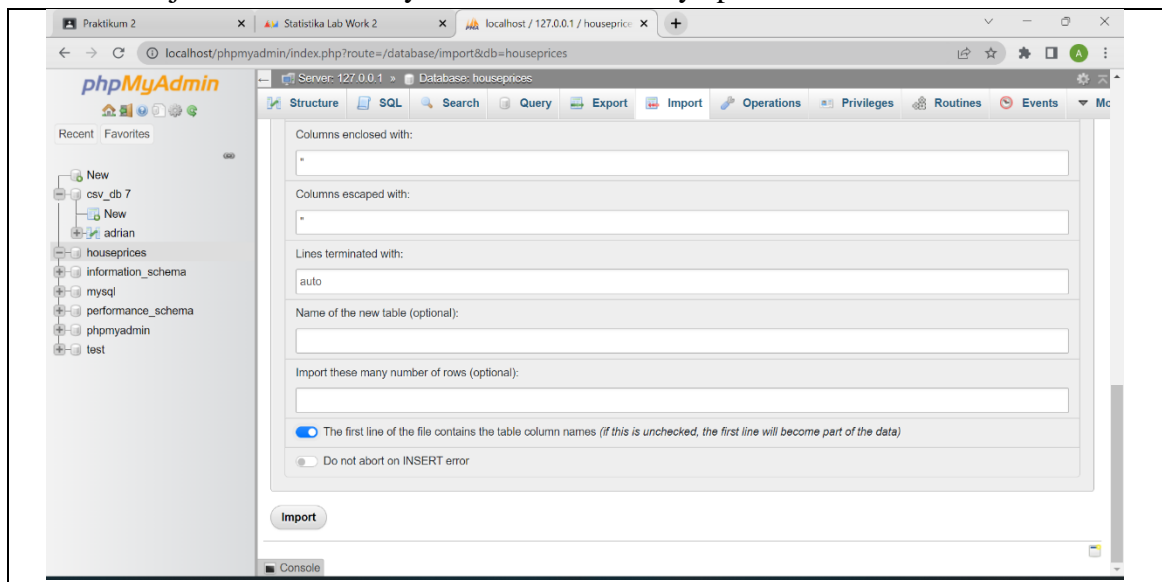

d. Latihan Keempat – Koneksi ke Database

1. Buat sebuah nama database terlebih dahulu dengan nama houseprices di phpmyadmin, Lalu klik menu import

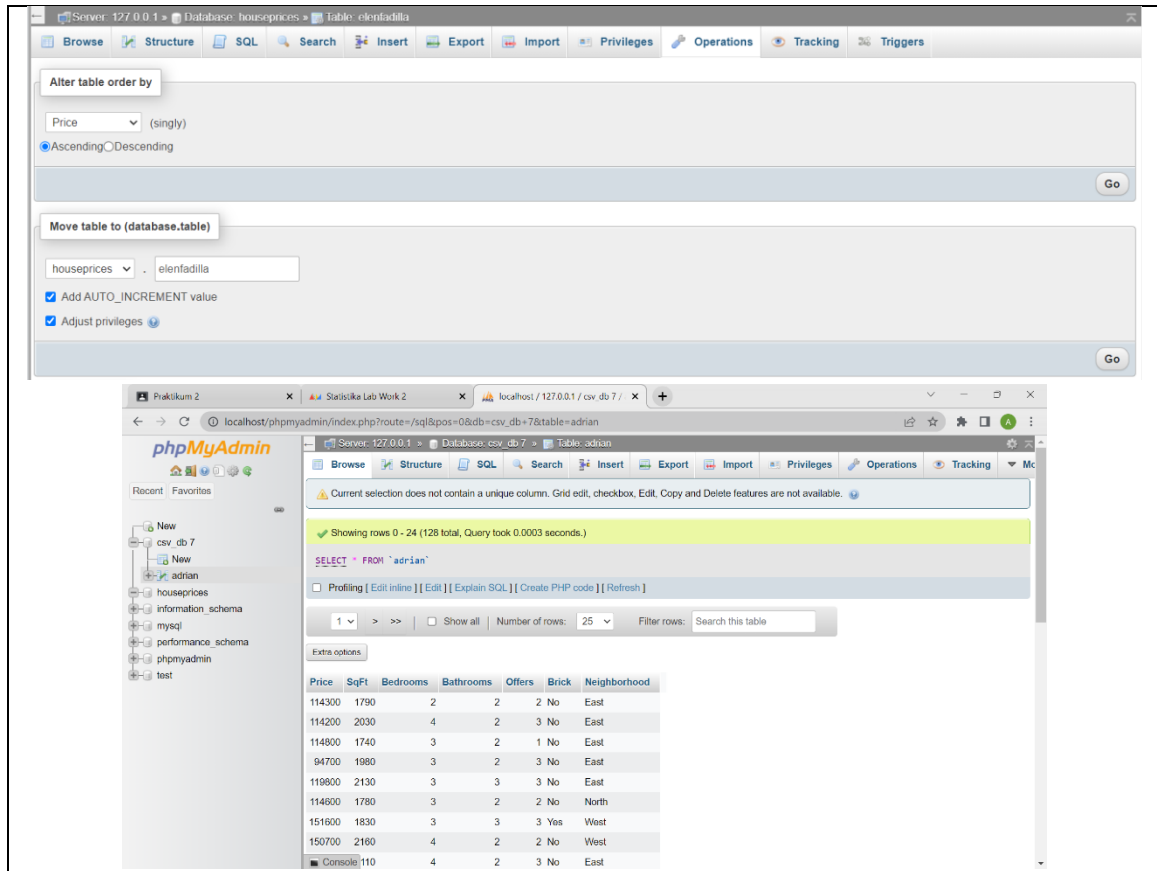

2. Pilih file yang ingin di import ke database (untuk file houseprices.csv), Ceklis *the first line of the file contains the table column name* untuk membuat baris pertama pada file excel tersebut menjadi nama atributnya atau nama kolomnya pada database.

3. Klik go, Rename nama tabel sesuai dengan nama anda

4. Kembali ke R Studio, lalu instal dahulu library yang dibutuhkan pada RStudio. Jika belum tersedia, maka lakukan instruksi:

```
install.packages("RMySQL")
```

```
install.packages("dplyr")
```

```
trying URL 'https://cran.rstudio.com/bin/windows/contrib/4.2/dplyr_1.0.10.zip'
Content type 'application/zip' length 1305159 bytes (1.2 MB)
downloaded 1.2 MB

package 'fansi' successfully unpacked and MD5 sums checked

The downloaded binary packages are in
C:\Users\User\AppData\Local\Temp\Rtmp8EBE6s\downloaded_packages
> library(RMySQL)
Loading required package: DBI
```

5. Lalu jalankan perintah dibawah ini

```
library(RMySQL)
```

```
con = dbConnect(MySQL(), user = 'root', password = '', dbname = 'houseprices', host =
'localhost')
dbListTables(con)
myQuery <- "select * from nama;"
df <- dbGetQuery(con, myQuery)
```

Output:

The screenshot shows the RStudio interface with the following components:

- Source Editor:** Contains R code for connecting to a MySQL database, listing tables, and querying data. The code includes comments and variable assignments.
- Environment:** Displays the current environment with variables like 'dataku', 'df', 'nama_matrix', and 'values'. It shows the number of observations and variables for each object.
- Files:** Shows the file explorer with a list of files and folders, including 'Rbuildignore', 'DESCRIPTION', 'man', 'NAMESPACE', 'Prak2.Rproj', and 'R'.
- Console:** Shows the output of the R code execution, including the results of the database connection, table listing, and data query.

e. Latihan Kelima – Teknik Filter Data

1. Jalankan perintah dibawah ini:

***Perintah ini akan menampilkan 86 baris data hasil filter.**

```
library(dplyr)
df<-filter(df,Brick=="No")
print(df)
```

Output:

The screenshot shows the RStudio IDE with the following components:

- Source Editor:** Contains R code for data manipulation using dplyr and dbplyr.
- Console:** Displays the output of the R code, showing a data frame with 105 rows and 7 columns.
- Environment Pane:** Shows the objects in the global environment, including 'dataku', 'df', 'nama_matrix', and 'values'.

The screenshot shows the RStudio IDE with the following components:

- Source Editor:** Contains R code for connecting to a MySQL database, querying data, and filtering it using dplyr.
- Environment Pane:** Lists objects in the global environment, including 'dataku', 'df', 'nama_matrix', and various character vectors.
- Console:** Displays the output of the R script, showing a table of data with columns for ID, Name, Age, Gender, and Location.

```
22 data_adrian <- data.frame(id = letters[1:10], x = 1:10, y = 11:20)
23 print(data_adrian)
24
25
26
27 install.packages("mysql")
28 install.packages("dplyr")
29
30 library(mysql)
31 con = dbConnect(MySQL(), user = 'root', password = '', dbname = 'csv_db', host = 'localhost')
32 dbListTables(con)
33 myQuery <- "select * from adrian;"
34 df <- dbGetQuery(con, myQuery)
35 view(df)
36
37 library(dplyr)
38 df <- filter(df, brick=="no")
39 print(df)
40
41 library(dplyr)
42 df <- filter(df, brick=="no" & neighborhood=="east")
43 print(df)
44
45
46
```

Environment Pane:

- dataku: 4 obs. of 3 variables
- df: 26 obs. of 7 variables
- nama_matrix: num [1:2, 1:2] 3 -27 15 38
- values: num [1:7] 1 2 -5 0.3 6 -2 4
- a: num [1:4] 1 2 3 4
- adrian1: chr [1:4] "red" "white" "red" NA
- adrian2: logi [1:4] TRUE TRUE TRUE FALSE
- b: chr [1:3] "one" "two" "three"
- c: logi [1:5] TRUE TRUE TRUE FALSE TRUE
- c_adrian: chr [1:2] "c1" "c2"
- cells: num [1:4] 3 15 -27 38
- myQuery: "select * from adrian;"
- r_adrian: chr [1:2] "r1" "r2"

Console Output:

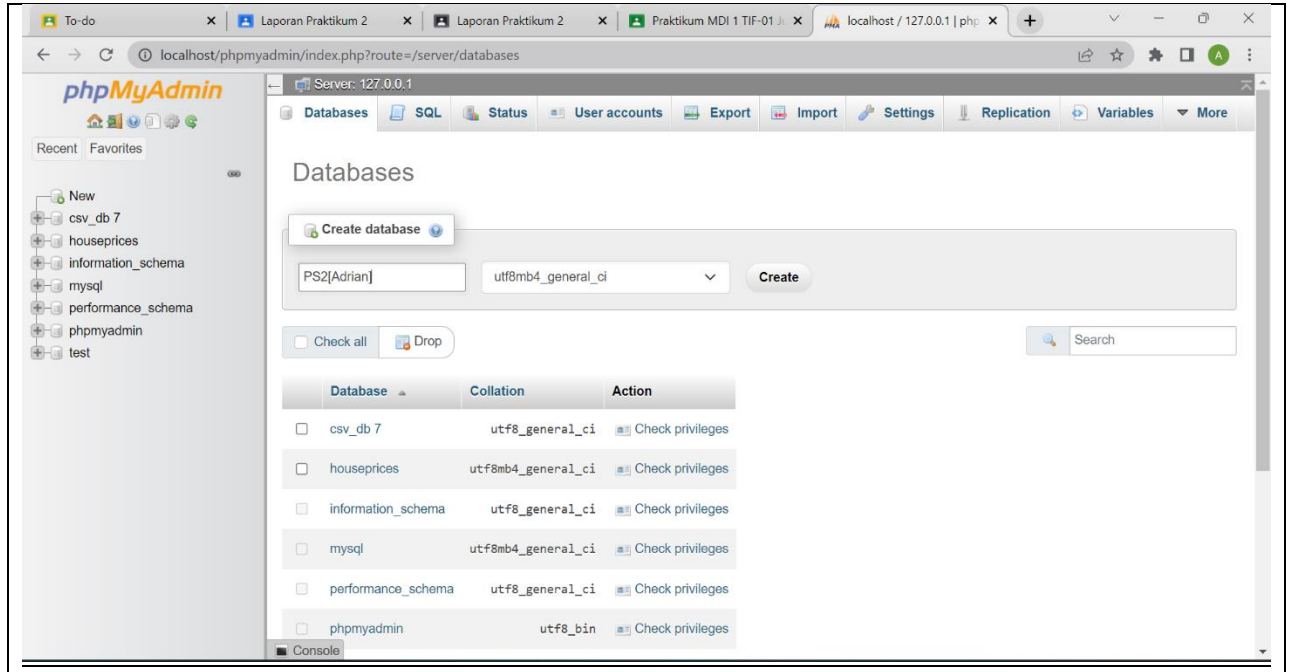

id	name	age	gender	location
1	a	1	2	3

f. Latihan Keenam – Tugas

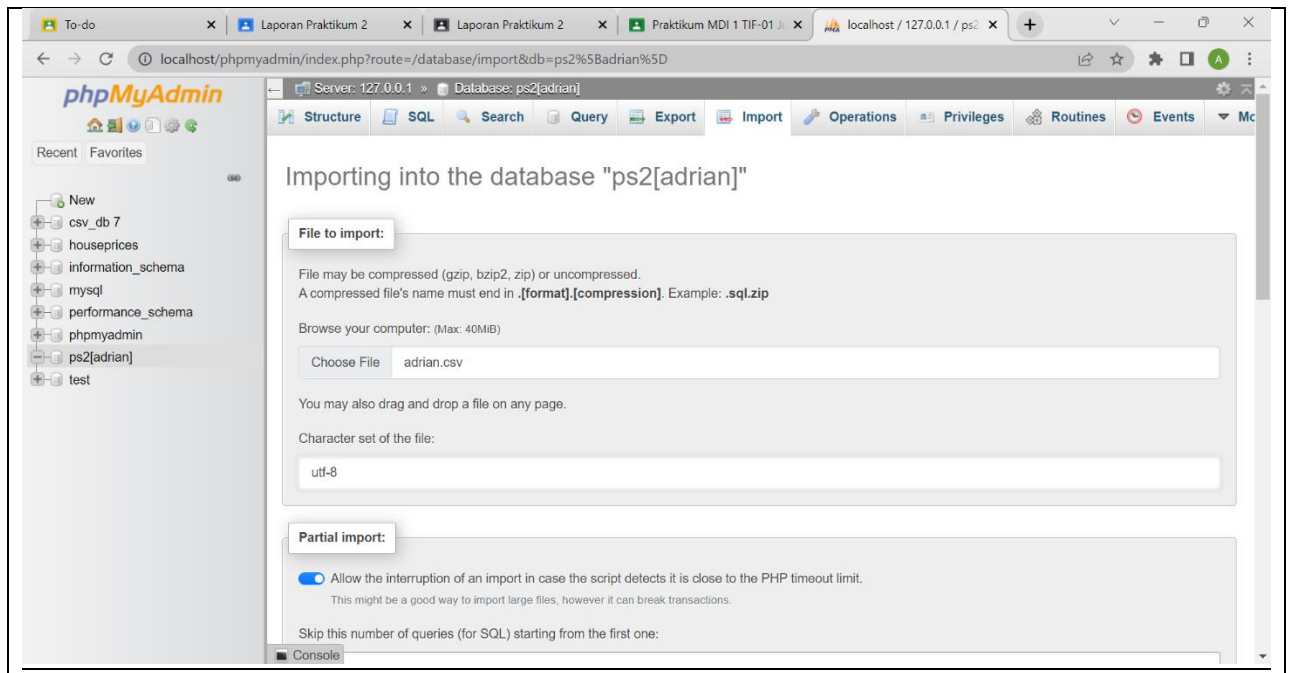

Buat sebuah database serta tabel di dalamnya (bisa gunakan data teman dipraktikum ke 1). Lakukan koneksi R ke database serta berikan beberapa filter data sesuai yang anda inginkan. Tampilkan data tersebut

1. Buatlah terlebih dahulu Database baru dengan format PS2[NamaAnda]

2. Import file berformat csv yang telah anda buat sebelumnya di Praktikum 1, dimana file tersebut berisi 6 kolom dan 20 baris data.

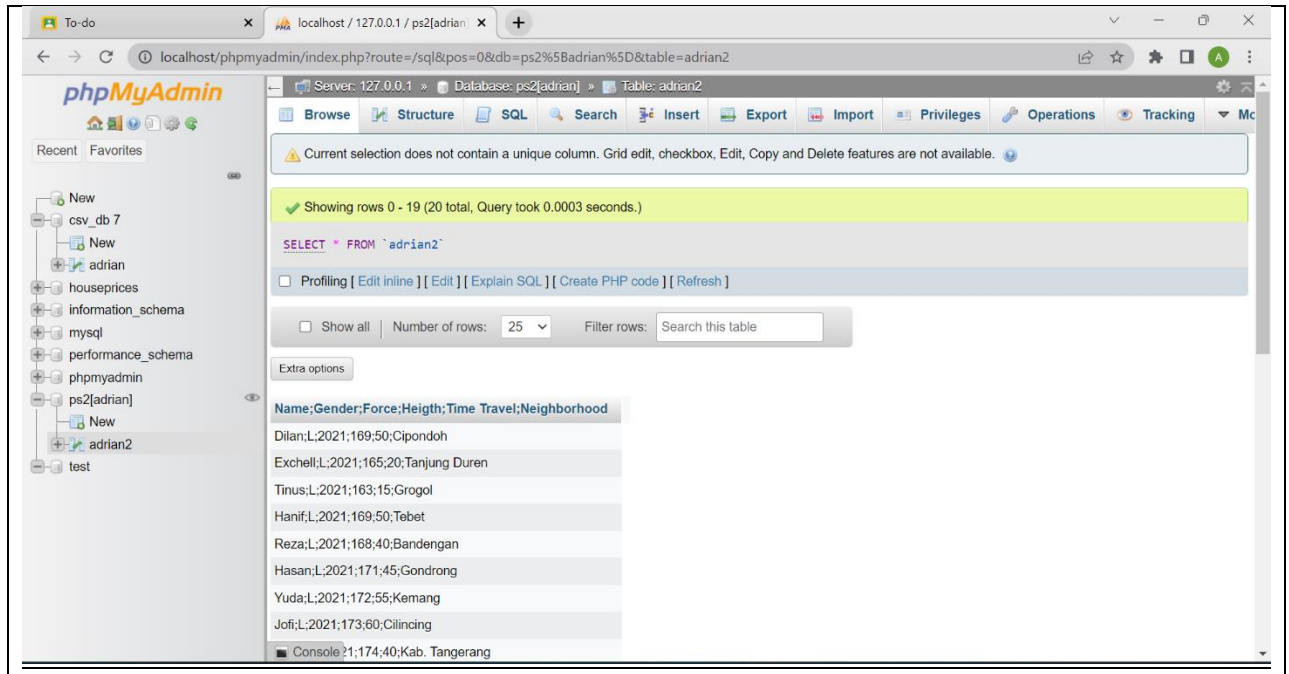

The image displays two screenshots of the phpMyAdmin web interface, specifically the 'Import' tab for a database named 'ps2[adrian]'.

Top Screenshot: Shows the 'Other options' and 'Format' sections. The 'Format' dropdown is set to 'CSV'. A note states: 'Note: If the file contains multiple tables, they will be combined into one.' The 'Format-specific options' section includes a checkbox for 'Update data when duplicate keys found on import (add ON DUPLICATE KEY UPDATE)' which is unchecked. Below this are input fields for 'Columns separated with:', 'Columns enclosed with:', and 'Columns escaped with:'.

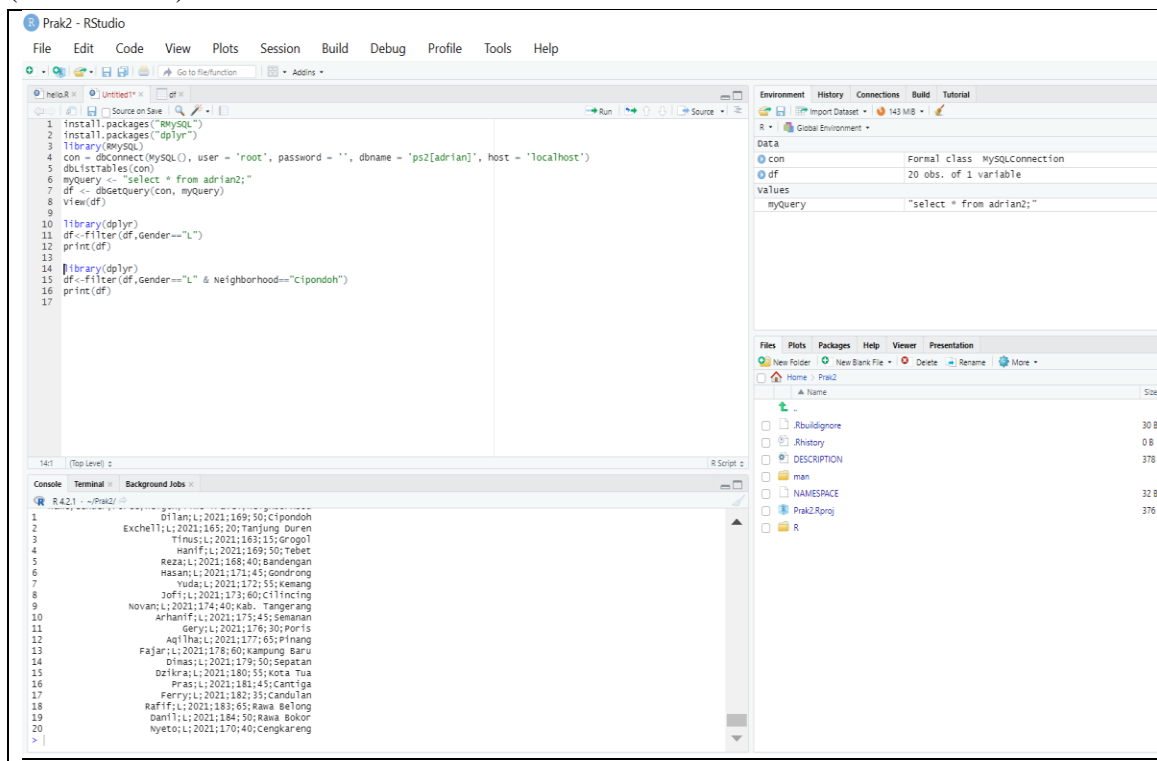

Bottom Screenshot: Shows the 'Format-specific options' section with more detailed settings. The 'Columns enclosed with:' field contains a double quote character. The 'Columns escaped with:' field contains a backslash character. The 'Lines terminated with:' field is set to 'auto'. The 'Name of the new table (optional):' field contains 'adrian2'. The 'Import these many number of rows (optional):' field is empty. There are two checkboxes: 'The first line of the file contains the table column names (if this is unchecked, the first line will become part of the data)' which is checked, and 'Do not abort on INSERT error' which is unchecked. An 'Import' button is visible at the bottom.

3. Koneksikan R ke Database tersebut sebagaimana yang telah anda lakukan pada Elemen Kompetensi 1 dimodul kedua ini dengan menyesuaikan kembali nama Database baru yang sudah dibuat.

4. Lakukan filter data terhadap Kolom Gender, untuk melihat berapa baris data Pria/Wanita (Pilih salah 1).

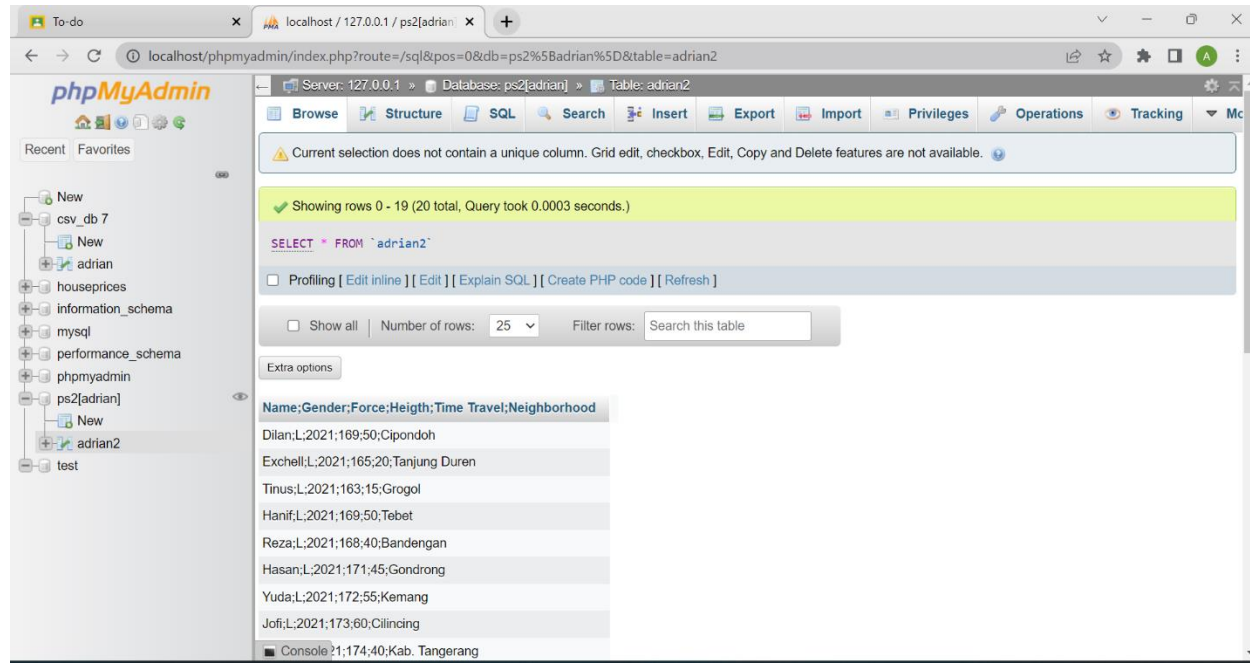

5. Lampirkan Screenshot

□ Hasil import file kedalam Database

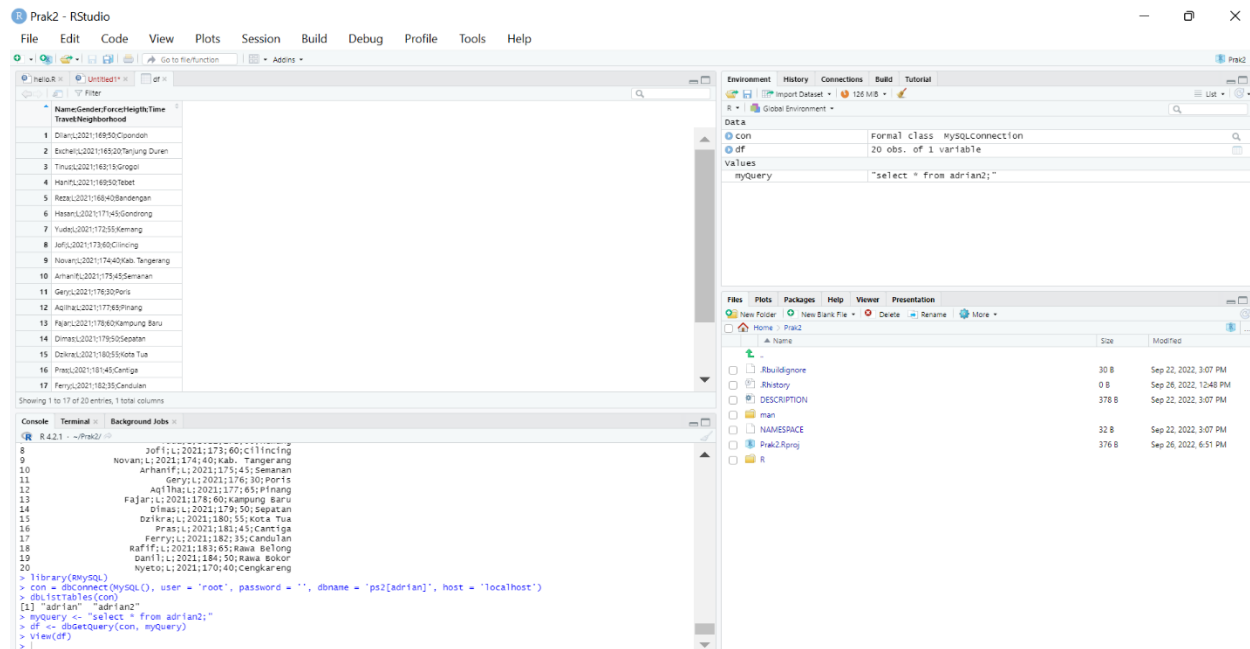

- ❑ Berhasilnya koneksi R ke Database
- ❑ Kode serta hasil filter di RStudio

Hasil import file ke dalam Database

Berhasilnya Koneksi R ke Database

Kode serta hasil filter di RStudio

The screenshot shows the RStudio IDE with a script titled 'df.R'. The script performs the following steps:

- 1. Install packages 'RMySQL' and 'dplyr'.
- 2. Load the 'RMySQL' library.
- 3. Establish a database connection using `dbConnect(MySQL(), user = 'root', password = '', dbname = 'ps2[adrian]', host = 'localhost')`.
- 4. List the tables in the database with `dbListTables(con)`.
- 5. Create a query object `myQuery <- "select * from adrian2;"`.
- 6. Execute the query with `df <- dbGetQuery(con, myQuery)`.
- 7. View the resulting data frame with `view(df)`.
- 8. Load the 'dplyr' library.
- 9. Filter the data frame by gender: `df <- filter(df, gender == "L")`.
- 10. Print the filtered data frame: `print(df)`.
- 11. Load the 'dplyr' library again.
- 12. Filter the data frame by gender and neighborhood: `df <- filter(df, gender == "L" & Neighborhood == "Cipondoh")`.
- 13. Print the final filtered data frame: `print(df)`.

The console output shows the execution of these commands, resulting in a data frame with 20 rows and 10 columns: Name, Gender, Force, Height, Time, Travel, Neighborhood, dllani, L, 2021, 169, 50, Cipondoh, exchell, L, 2021, 165, 20, Tanjung Puren, Tifus, L, 2021, 163, 15, Grogol, Hanif, L, 2021, 169, 50, Tabet, Reza, L, 2021, 168, 40, Bandung, Hasani, L, 2021, 171, 45, Gondrong, Yuda, L, 2021, 172, 55, Kenang, Joffi, L, 2021, 173, 60, Cilincing, Novan, L, 2021, 174, 40, Kab. Tangerang, Arhan, L, 2021, 175, 45, Semang, Gery, L, 2021, 176, 30, Poris, Aqil, L, 2021, 177, 65, Pinang, Fajar, L, 2021, 178, 60, Kampung Baru, Dima, L, 2021, 179, 50, Sepatan, Dzikra, L, 2021, 180, 55, Kota Tua, Pras, L, 2021, 181, 45, Candi, Ferry, L, 2021, 182, 35, Candulan, Rafi, L, 2021, 183, 65, Rawa Belong, Dani, L, 2021, 184, 50, Rawa Boko, Nurro, L, 2021, 170, 40, Pankajene.

4. File Praktikum

Github Repository:

5. Soal Latihan

Soal:

1. Ada berapa tipe data yang data di deklarasikan oleh Rstudio?
2. Bagaimana cara memanggil sebuah tabel di dalam database ke Rstudio?

Jawaban:

1. Tipe data yang dideklarasikan oleh RStudio, diantaranya :

-Character(Char), -Numeric, -Integer, -Logical, -Complex, -Vektor, -Matriks dan -Data frame

2. Cara memanggil sebuah table di dalam database ke RStudio menggunakan perintah

`library(RMySQL)`

`con = dbConnect(MySQL(), user = 'root', password = "", dbname = 'ps2[adrian]', host = 'localhost')`

`dbListTables(con)`

`myQuery <- "select * from adrian2;"`

```
df <- dbGetQuery(con, myQuery)
```

```
View(df)
```

Setelah berhasil menginstal package (RMySQL).

6. Kesimpulan

- Dalam pengerjaan praktikum Statistika, kita harus mengetahui apa saja tipe data yang dideklarasikan oleh RStudio, diantaranya yaitu Vektor, Matriks, dan Data Frame.
- Kita juga dapat mengetahui bahwa R dapat di koneksikan kedalam Database dari localhost/phpMyAdmin web, dengan membuat Database dan meng import file ke dalam database yang sudah dibuat, kemudian menggunakan sintaks/perintah koneksi ke database sebagaimana yang sudah tertera dalam modul.

7. Cek List (✓)

No	Elemen Kompetensi	Penyelesaian	
		Selesai	Tidak Selesai
